

How to create a constant variable in python

we cannot declare a variable or value as constant in Python.

But we can indicate to programmers that a variable is a constant by using an all upper case variable name.

This is the common practice to create a constant in Python:

```
CONST_PL = 9
```

Even though we can change the value, it is then the programmer's responsibility to leave this variable unchanged.

There is another way to make variable immutable by :
freezing

code:

```
from pyrsistent import freeze
```

```
d = {"a":1, "b": 2}
```

```
d = freeze(d) # immutable dictionary
```

```
print(d)
```

If you want to change a value you need to create a new
object using "update"

```
d.update( {"b":10})
```
